**Practice Problem 1: Personal Information & Simple Calculator**

Task:

Create a Python program named personal_calculator.py that performs the following tasks:

1. Ask the user for their name.
2. Ask for their age.
3. Ask for two numbers.
4. Calculate the sum, subtraction, multiplication, and division of those two numbers.
5. Display all information in a well-formatted output using f-strings.

Expected Output Example:

Enter your name: Rahim

Enter your age: 22

Enter first number: 20

Enter second number: 10

Hello, Rahim!

Your age is 22.

Addition: 30

Subtraction: 10

Multiplication: 200

Division: 2.0

**Practice Problem 2: Student Grade Calculator**

Task:

Create a Python program named grade_calculator.py that:

1. Takes a student's name as input.
2. Takes marks for three subjects.
3. Calculates the average marks.
4. Determines the grade using the following conditions:

| Average Marks | Grade |
|---|---|
| 80–100 | A+ |
| 70–79 | A |
| 60–69 | A- |
| 50–59 | B |
| 40–49 | C |
| Below 40 | F |

5. Display the student's name, average marks, and final grade.
6. If any subject mark is below 0 or above 100, display an invalid marks message.

Expected Output Example:

Enter student name: Rahim

Enter Math marks: 85

Enter English marks: 75

Enter Python marks: 90

Student Name: Rahim

Average Marks: 83.33

Final Grade: A+

**GitHub Submission Instructions**

Students must submit both practice problems through GitHub.

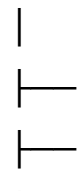

Step 1: Create a GitHub repository

- Log in to your GitHub account.
- Create a new public repository.
- Repository name: python-practice-assignment

Step 2: Organize your files

Your repository should look like this:

python-practice-assignment/

Step 3: Submit your assignment

Copy your GitHub repository URL and paste it into the submission text box.
